

Usability Engineering – I

The DECIDE framework is an overall well developed framework, however it is my opinion there are certain areas that may limit the scope of the conceptual design or prototype. It is good practice to follow a certain sequence of steps to simplify and streamline a methodical process, but often through this process we unknowingly limit ourselves as we are bounded by tight constraints which may deter us from achieving the optimal result.

1. **Constraints that may Limit the goal:** It is difficult to determine the goals of a project as it is always volatile and can be subjected to change based on a wide array of factors some being priorities, feasibility, logistics, future usability testing etc. To be subjected to put constraints as the first step already sets limiting boundaries on the scope of the project and may eventually lead to the design or prototype from reaching its true capability/nature.
2. **Issue of Boundless questions:** While the idea behind this is novel, the application of this may however prove to be ineffective simply because of it being boundless. For instance, it is advised that we have several questions of which we further have incrementally more sub-questions and so on and so forth. While simplifying and finding the resting information at its core may have its merits, it is important that we first consider if it is even useful to be putting in all the effort and time especially since the implementation of this can be very expensive in terms of time and money.
3. **Merging the Evaluation Method:** One way of improving on this would be considering of ways where we can merge two evaluation methods, as every evaluation method have their own corresponding merits and demerits and by merging them we may be able to eliminate their demerits and customize them to be most optimal for the given situation
4. **Reliability of Data:** The evaluation, analyzation, interpretation and presentation of data will depend on obtaining credible and reliable data. We need to enforce measures and steps to ensure that the data obtained from the sources either through various test or partnered companies goes through a screening process to validate the authenticity and reliability of the data as they will be used to process the following steps that will eventually be presented
